Serial EEPROM Series Standard EEPROM
SPI BUS EEPROM
BR25G256-3

General Description
BR25G256-3 is a 256Kbit serial EEPROM of SPI BUS interface.

Features
- High Speed Clock Action up to 20MHz (Max)
- Wait Function by HOLDB Terminal
- Part or Whole of Memory Arrays Settable as Read only Memory Area by Program
- 1.6V to 5.5V Single Power Source Operation Most Suitable for Battery Use.
- UP to 64 Byte in Page Write Mode.
- For SPI bus interface (CPOL, CPHA) = (0, 0), (1, 1)
- Self-timed Programming Cycle
- Low Current Consumption
  - At Write Action (5V) : 0.6mA (Typ)
  - At Read Action (5V) : 2.0mA (Typ)
  - At Standby Action (5V) : 0.1µA (Typ)
- Address Auto Increment Function at Read Action
- Prevention of Write Mistake
  - Write Prohibition at Power On
  - Write Prohibition by Command Code (WRDI)
  - Write Prohibition by WPB Pin
  - Write Prohibition Block Setting by Status Registers (BP1, BP0)
- Prevention of Write Mistake at Low Voltage
- More than 100 years Data Retention.
- More than 1 Million Write Cycles.
- Bit Format 32Kx8
- Initial Delivery Data
  Memory Array: FFh
  Status Register: WPEN, BP1, BP0 : 0

Packages W(Typ) x D(Typ) x H(Max)

</tbody>
</table>

**Caution:** Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

(Note1) Not Recommended for New Designs.

Features

1. Status Registers
   This IC has status register. The status register expresses the following parameters of 8 bits.
   BP0 and BP1 can be set by write status register command. These 2 bits are memorized into the EEPROM, therefore are
   valid even when power source is turned off.
   Rewrite characteristics and data hold time are same as characteristics of the EEPROM.
   WEN can be set by write enable command and write disable command. WEN becomes write disable status when power
   source is turned off. R/B is for write confirmation, therefore cannot be set externally.
   The value of status register can be read by read status register command.

(1) Contexture of Status Register

<table>
<thead>
<tr>

<td>0</td>
<td>4000h-7FFFh</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0000h-7FFFh</td>
</tr>
</tbody>
</table>

2. WPB Pin
   By setting WPB=LOW, write command is prohibited. And the write command to be disabled at this moment is WRSR.
   However, when write cycle is in execution, no interruption can be made.

<table>
<thead>
<tr>
<th>WRSR</th>
<th>WRITE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prohibition possible but WPEN bit “1”</td>
<td>Prohibition impossible</td>
</tr>
</tbody>
</table>

3. HOLDPin
   By HOLD pin, data transfer can be interrupted. When SCK="0", by making HOLD from "1" into"0", data transfer to
   EEPROM is interrupted. When SCK = “0”, by making HOLD from “0” into “1”, data transfer is restarted.

</tbody>
</table>

### Timing Chart

1. Write Enable (WREN) / Disable (WRDI) Command

This IC has write enable status and write disable status. It is set to write enable status by write enable command, and it is set to write disable status by write disable command. As for these commands, set CSB LOW, and then input the respective ope codes. The respective commands are accepted at the 7-th clock rise. Even with input over 7 clocks, command becomes valid.

When to carry out write command, it is necessary to set write enable status by the write enable command. If write command is input in the write disable status, the command is cancelled. And even in the write enable status, once write command is executed, it gets in the write disable status. After power on, this IC is in write disable status.

2. Read Command (READ)

By read command, data of EEPROM can be read. As for this command, set CSB LOW, then input address after read ope code. EEPROM starts data output of the designated address. Data output is started from SCK fall of 23-th clock, and from D7 to D0 sequentially. This IC has increment read function. After output of data for 1 byte (8bits), by continuing input of SCK, data of the next address can be read. Increment read can read all the addresses of EEPROM. After reading data of the most significant address, by continuing increment read, data of the most insignificant address is read.
3. Write Command (WRITE)

![Figure 40. Write command](image)

By write command, data of EEPROM can be written. As for this command, set CSB LOW, then input address and data after write ope code. Then, by making CSB HIGH, the EEPROM starts writing. The write time of EEPROM requires time of \( t_{EW} \) (Max 5ms). During \( t_{EW} \), other than read status register command is not accepted. Set CSB HIGH between taking the last data (D0) and rising the next SCK clock. At the other timing, write command is cancelled. This IC has page write function, and after input of data for 1 byte (8 bits), by continuing data input without setting CSB HIGH, 2byte or more data can be written for one \( t_{EW} \). Up to 64 arbitrary bytes can be written. In page write, the insignificant 6 bit of the designated address is incremented internally at every time when data of 1 byte is input and data is written to respective addresses. When data of the maximum bytes or higher is input, address rolls over, and previously input data is overwritten.

4. Write Status Register, Read Status Register Command (WRSR/RDSR)

![Figure 41. Write status register](image)

Write status register command can write data of status register. The data can be written by this command are 3 bits, that is, WPEN (bit7), BP1 (bit3) and BP0 (bit2) among 8 bits of status register. By BP1 and BP0, write disable block of EEPROM can be set. As for this command, set CSB LOW, and input ope code of write status register, and input data. Then, by making CSB HIGH, EEPROM starts writing. Write time requires time of \( t_{EW} \) as same as write. As for CSB rise, set CSB HIGH between taking the last data bit (bit0) and the next SCK clock rising. At the other timing, command is cancelled. Write disable block is determined by BP1 BP0, and the block can be selected from 1/4, 1/2, and entire of memory array (Refer to the write disable block setting table.). To the write disabled block, write cannot be made, and only read can be made.

![Figure 42. Read status register command](image)
WBP Cancel Valid Area

WBP is normally fixed to "H" or "L" for use, but when WBP is controlled so as to cancel write status register command, pay attention to the following WBP valid timing.

While write status register command is executed, by setting WBP = "L" in cancel valid area, command can be cancelled. The area from command operation code to CSB rise at internal automatic write start becomes the cancel valid area. However, once write is started, by any input write cycle cannot be cancelled. WBP input becomes Don't Care, and cancellation becomes invalid.

While write status register command is executed, by setting WPB = "L" in cancel valid area, command can be cancelled. The area from command operation code to CSB rise at internal automatic write start becomes the cancel valid area. However, once write is started, by any input write cycle cannot be cancelled. WBP input becomes Don’t Care, and cancellation becomes invalid.

\[\begin{array}{ccc}
\text{SCK} & 6 & 7 \\
\text{Ope Code} & \text{Data} & \text{Data write time} \\
\text{Invalid} & \text{Valid} & \text{Invalid} \\
\end{array}\]

Figure 43. WPB valid timing (At inputting WRSR command)

HOLDB Pin

By HOLDB pin, command communication can be stopped temporarily (HOLD status). The command communications are carried out when the HOLDB pin is HIGH. To get in HOLD status, at command communication, when SCK=LOW, set the HOLDB pin LOW. At HOLD status, SCK and SI become Don’t Care, and SO becomes high impedance (High-Z). To release the HOLD status, set the HOLDB pin HIGH when SCK=LOW. After that, communication can be restarted from the point before the HOLD status. For example, when HOLD status is made after A5 address input at read, after release of HOLD status, by starting A4 address input, read can be restarted. When in HOLD status, keep CSB LOW. When it is set CSB=HIGH in HOLD status, the IC is reset, therefore communication after that cannot be restarted.
Method to Cancel Each Command

1. READ, RDSR
   - Method to cancel: cancel by CSB = "H".

   Figure 44. READ cancel valid timing

   Figure 45. RDSR cancel valid timing

2. WRITE, PAGE WRITE
   a: Ope code or address input area
   Cancellation is available by CSB="H".
   b: Data input area (D7 to D1 input area)
   Cancellation is available by CSB="H".
   c: Data input area (D0 area)
   In this area, cancellation is not available.
   When CSB is set HIGH, write starts.
   d: tE/W area
   In the area c, by rising CSB, write starts.
   While writing, by any input, cancellation cannot be made.

   Note1) If Vcc is made OFF during write execution, designated address data is not guaranteed, therefore write it once again.
   Note2) If CSB is rised at the same timing as that of the SCK rise, write execution / cancel becomes unstable, therefore, it is recommended to rise in SCK = "L" area. As for SCK rise, assure timing of tCSS / tCSH or more.

3. WRSR
   a: From ope code to 15-th clock rise
   Cancellation is available by CSB="H".
   b: From 15-th clock rise to 16-th clock rise (write enable area)
   In this area, cancellation is not available by CSB="H".
   When CSB is set HIGH, write starts.
   c: After 16-th clock rise.
   Cancellation is available by CSB="H".
   However, if write starts (CSB is rised) In the area b, cancellation cannot be made by any means.
   And, by inputting on SCK clock, cancellation cannot be made.

   Note1) If Vcc is made OFF during write execution, designated address data is not guaranteed, therefore write it once again
   Note2) If CSB is rised at the same timing as that of the SCK rise, write execution / cancel becomes unstable, therefore, it is recommended to rise in SCK = "L" area. As for SCK rise, assure timing of tCSS / tCSH or more.

4. WREN/WRDI
   a: From ope code to 7-th clock rise, cancellation is available by CSB = "H".
   b: Cancellation is not available 7-th clock.

   Figure 46. WRITE cancel valid timing

   Figure 47. WRSR cancel valid timing

   Figure 48. WREN/WRDI cancel valid timing
I/O Peripheral Circuits

In order to realize stable high speed operations, pay attention to the following input / output pin conditions.

Input pin pull up, pull down resistance

When to attach pull up, pull down resistance to EEPROM input pin, select an appropriate value for the microcontroller \( V_{OL} \), \( I_{OL} \) with considering \( V_{IL} \) characteristics of this IC.

1. Pull Up Resistance

\[
R_{PU} \geq \frac{V_{CC} - V_{OLM}}{I_{OLM}} \quad \cdots (1)
\]

\[
V_{OLM} \leq V_{ILE} \quad \cdots (2)
\]

Example) When \( V_{CC}=5V \), \( V_{ILE}=1.5V \), \( V_{OLM}=0.4V \), \( I_{OLM}=2mA \), from the equation (1),

\[
R_{PU} \geq \frac{5 - 0.4}{2 \times 10^{-3}}
\]

\[
\Rightarrow R_{PU} \geq 2.3[k\Omega]
\]

With the value of \( R_{PU} \) to satisfy the above equation, \( V_{OLM} \) becomes 0.4V or lower, and with \( V_{ILE}(=1.5V) \), the equation (2) is also satisfied.

- \( V_{ILE} \) : EEPROM \( V_{IL} \) specifications
- \( V_{OLM} \) : Microcontroller \( V_{OL} \) specifications
- \( I_{OLM} \) : Microcontroller \( I_{OL} \) specifications

And, in order to prevent malfunction or erroneous write at power ON/OFF, be sure to make CSB pull up.

2. Pull Down Resistance

\[
R_{PD} \geq \frac{V_{OHM}}{I_{OHM}} \quad \cdots (3)
\]

\[
V_{OHM} \geq V_{IHE} \quad \cdots (4)
\]

Example) When \( V_{CC}=5V \), \( V_{IHE}=V_{CC}-0.5V \), \( I_{OHM}=0.4mA \), \( V_{IHE}=V_{CC} \times 0.7V \), from the equation (3),

\[
R_{PD} \geq \frac{5 - 0.5}{0.4 \times 10^{-3}}
\]

\[
\Rightarrow R_{PD} \geq 11.3[k\Omega]
\]

Further, by amplitude \( V_{IHE}, \ V_{IHE} \) of signal input to EEPROM, operation speed changes. By inputting \( V_{CC}/GND \) level amplitude of signal, more stable high speed operations can be realized. On the contrary, when amplitude of 0.8Vcc/0.2Vcc is input, operation speed becomes slow. \(^{(Note1)}\)

In order to realize more stable high speed operation, it is recommended to make the values of \( R_{PU}, R_{PD} \) as large as possible, and make the amplitude of signal input to EEPROM close to the amplitude of \( V_{CC} / GND \) level.

\(^{(Note1)}\) In this case, guaranteed value of operating timing is guaranteed.

3. SO Load Capacity Condition

Load capacity of SO output pin affects upon delay characteristic of SO output (Data output delay time, time from HOLDB to High-Z, Output rise time, Output fall time,). In order to make output delay characteristic into better, make SO load capacity small.

4. Other cautions

Make the each wire length from the microcontroller to EEPROM input pin same length, in order to prevent setup / hold violation to EEPROM, owing to difference of wire length of each input.
Equivalent Circuit

1. Output Circuit

![Output Circuit Diagram](image1)

Figure 52. SO output equivalent circuit

2. Input Circuit

![Input Circuit Diagrams](image2, image3, image4, image5)

Figure 53. CSB input equivalent circuit
Figure 54. SCK input equivalent circuit
Figure 55. SI input equivalent circuit
Figure 56. HOLDB input equivalent circuit
Figure 57. WPB input equivalent circuit
Power-Up/Down Conditions

1. At Standby
   Set CSB “H”, and be sure to set SCK, SI input “L” or “H”. Do not input intermediate electric potantial.

2. At Power ON/OFF
   When Vcc rise or fall, set CSB=”H” (=Vcc).
   When CSB is “L”, this IC gets in input accept status (active). If power is turned on in this status, noises and the likes may cause malfunction, erroneous write or so. To prevent these, at power ON, set CSB “H”. (When CSB is in “H” status, all inputs are canceled.)

3. Operating Timing after Power ON
   As shown in Figure 53, at standby, when SCK is “H”, even if CSB is fallen, SI status is not read at fall edge. SI status is read at SCK rise edge after fall of CSB. At standby and at power ON/OFF, set CSB “H” status.

4. At Power on Malfunction Preventing Function
   This IC has a POR (Power On Reset) circuit as mistake write countermeasure. After POR action, it gets in write disable status. The POR circuit is valid only when power is ON, and does not work when power is OFF. When power is ON, if the recommended conditions of the following tr, tOFF, and Vbot are not satisfied, it may become write enable status owing to noises and the likes.

5. Low Voltage Malfunction Preventing Function
   LVCC (Vcc-Lockout) circuit prevents data rewrite action at low power, and prevents wrong write. At LVCC voltage (Typ =1.2V) or below, it prevent data rewrite.
Noise Countermeasures

1. Vcc Noise (bypass capacitor)
   When noise or surge gets in the power source line, malfunction may occur, therefore, for removing these, it is recommended to attach a bypass capacitor (0.1µF) between IC Vcc and GND. At that time, attach it as close to IC as possible.
   And, it is also recommended to attach a bypass capacitor between board Vcc and GND.

2. SCK Noise
   When the rise time of SCK (t_{RC}) is long, and a certain degree or more of noise exists, malfunction may occur owing to clock bit displacement. To avoid this, a Schmitt trigger circuit is built in SCK input. The hysteresis width of this circuit is set about 0.2V, if noises exist at SCK input, set the noise amplitude 0.2Vp-p or below. And it is recommended to set the rise time of SCK (t_{RC}) 100ns or below. In the case when the rise time is 100ns or higher, take sufficient noise countermeasures. Make the clock rise, fall time as small as possible.

3. WPB Noise
   During execution of write status register command, if there exist noises on WPB pin, mistake in recognition may occur and forcible cancellation may result. To avoid this, a Schmitt trigger circuit is built in WPB input. In the same manner, a Schmitt trigger circuit is built in CSB input, SI input and HOLDB input too.
Operational Notes

1. **Reverse Connection of Power Supply**
   Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC’s power supply pins.

2. **Power Supply Lines**
   Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. **Ground Voltage**
   Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. **Ground Wiring Pattern**
   When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. **Thermal Consideration**
   Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. The absolute maximum rating of the Pd stated in this specification is when the IC is mounted on a 70mm x 70mm x 1.6mm glass epoxy board. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

6. **Recommended Operating Conditions**
   These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. **Inrush Current**
   When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. **Operation Under Strong Electromagnetic Field**
   Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. **Testing on Application Boards**
   When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC’s power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

10. **Inter-pin Short and Mounting Errors**
    Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.
Operational Notes – continued

11. **Unused Input Pins**
   Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

12. **Regarding the Input Pin of the IC**
   In the construction of this IC, P-N junctions are inevitably formed creating parasitic diodes or transistors. The operation of these parasitic elements can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions which cause these parasitic elements to operate, such as applying a voltage to an input pin lower than the ground voltage should be avoided. Furthermore, do not apply a voltage to the input pins when no power supply voltage is applied to the IC. Even if the power supply voltage is applied, make sure that the input pins have voltages within the values specified in the electrical characteristics of this IC.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipment (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM’s Products for Specific Applications.

(Note 1) Medical Equipment Classification of the Specific Applications

<table>
<thead>
<tr>
<th>JAPAN</th>
<th>USA</th>
<th>EU</th>
<th>CHINA</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLASS III</td>
<td>CLASS III</td>
<td>CLASS II b</td>
<td>CLASS III</td>
</tr>
</tbody>
</table>

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:

[a] Installation of protection circuits or other protective devices to improve system safety
[b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:

[a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
[b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
[c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
[d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
[e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
[f] Sealing or coating our Products with resin or other coating materials
[g] Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.) ; or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
[h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification
Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic
This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation
1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂;
   [b] the temperature or humidity exceeds those recommended by ROHM;
   [c] the Products are exposed to direct sunshine or condensation;
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label
A two-dimensional barcode printed on ROHM Products label is for ROHM’s internal use only.

Precaution for Disposition
When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act
Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights
1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution
1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM’s Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM’s Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
