

Automotive Intelligent Power Device Single Channel 20 mΩ High Side Switch

BV1HB020EFJ-C

General Description

The BV1HB020EFJ-C single channel 20 mΩ Intelligent High Side Power Device integrates an Overcurrent load protection, a dual Temperature Shutdown mechanism which limits the internal thermal transients and reduces the mechanical stress of the IC, and a smart Active-Clamp circuit to dissipate the magnetic energy while switching off inductive loads and to protect internal circuits from overvoltage surges. Embedded Current Sense and Diagnostic features provide real time load current information and open or short circuit feedback in both on and off state. A 3 V and 5 V CMOS compatible input pin offers direct microcontroller connection without special interfaces or level shifters. These in conjunction with a wide input voltage range make the High Side IPD a high-performance component suitable for 12 V battery connected automotive applications.

Key Specifications

■ Supply Nominal Voltage Range:	6 V to 28 V
■ Low Operating Voltage (cranking):	4 V (Max)
■ Overvoltage Protection:	41 V (Min)
■ ON Resistance:	20 mΩ (Typ)
■ Overcurrent Limit:	51 A (Typ)
■ Sleep Current:	0.5 μA (Max)
■ Operating Current:	3 mA (Typ)
■ Junction Temperature Range (Tj):	-40 °C to +150 °C

Package

HTSOP-J8

 W (Typ) x D (Typ) x H (Max)
 4.9 mm x 6.0 mm x 1.0 mm

Features

- AEC-Q100 Qualified^(Note 1)
- Short Circuit Load Protection
- Overcurrent Limitation
- Active Clamp and Overvoltage Protection
- Dual Temperature Shutdown
- Undervoltage Lock Out
- Integrated Current SENSE Circuit
- Loss of Ground Protection
- Open Load and Short to Battery Diagnostics

(Note 1) Grade 1

Applications

- Driver for Resistive, Inductive and Capacitive Loads
- MOSFET, Relay and Fuse Replacement
- Intelligent Power Device for 12 V Automotive Applications

- Thermally Enhanced Thin Small-Outline 8 pin package with 1.27 mm Pin Pitch
- Exposed Pad for improved thermal performance

Typical Application Circuit

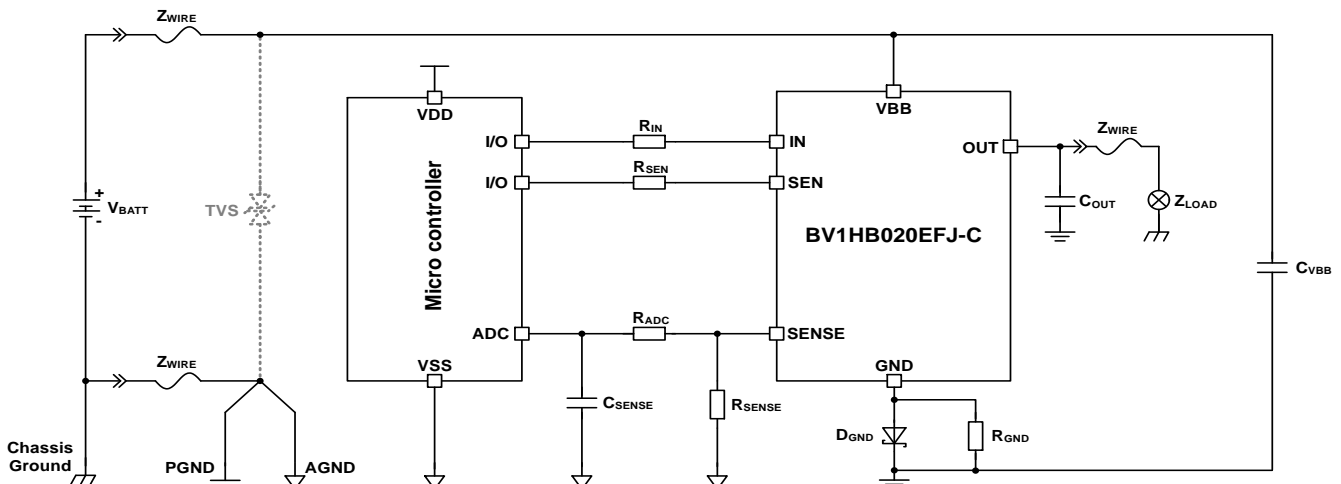

Figure 1. Typical Application Diagram

○Product structure : Silicon integrated circuit ○This product has no designed protection against radioactive rays.

Pin Configuration

Figure 2. Pin Configuration

Pin Description

Pin No.	Pin Name	Function
1	GND	Device Ground pin
2	IN	Input Pin. Turns on the Switch. Active “High”
3	SEN	Current Sense and diagnostic enable. Active “High”
4	SENSE	Current Sense analog output pin
5 to 8	OUT	High Side Switch Power Output ^(Note 1)
EXP-PAD	VBB	Exposed-Pad. Power Supply Voltage Line Input

^(Note 1) Output pins are internally shorted. Please connect the respective pins together on the PCB such as the metal traces can withstand the desired maximum current.

Definitions

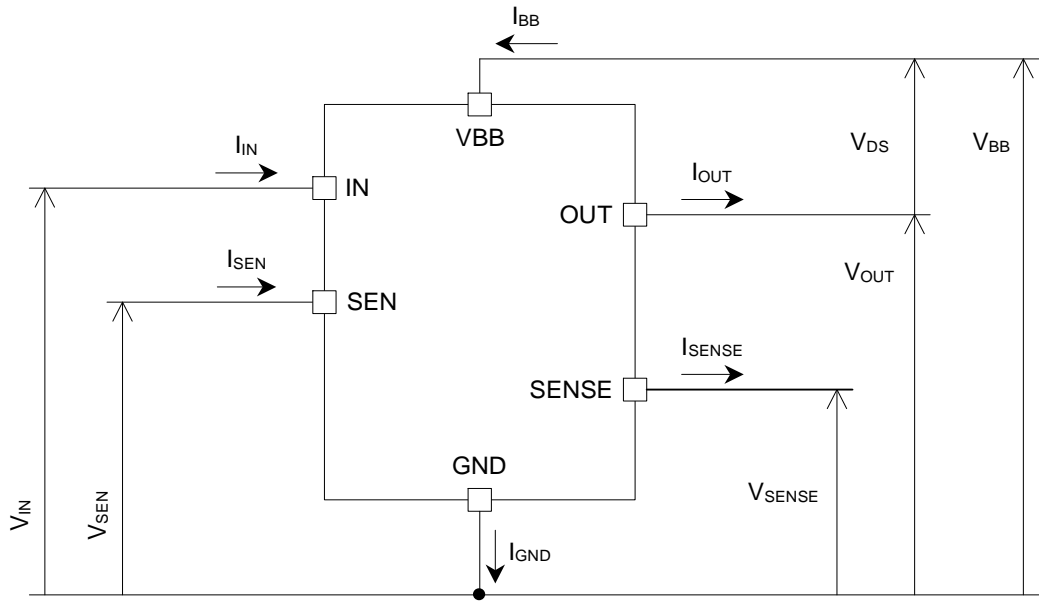

Figure 3. Voltage and Current Definitions

Absolute Maximum Ratings

Parameters	Symbol	Ratings	Unit	Conditions
[Power Supply / GND pin]				
DC Supply Voltage	V_{BB}	-0.3 to +36	V	
Supply Voltage at load dump	V_{BB_LD}	40	V	ISO16750-2, $R_i = 2\ \Omega$
Supply Voltage (Output to GND short) (Note 4)	V_{BB_SC}	-0.3 to +24	V	AEC-Q100-012
Supply Voltage (When battery is connected in reverse direction)	V_{BB_REV}	-16	V	less than 2 minutes, $T_j = 25\ ^\circ\text{C}$, $R_L > 4\ \Omega$, D_{GND} , R_{GND} connected
GND Pin Current	I_{GND}	-50 to +30	mA	less than 2 minutes, $T_j = 25\ ^\circ\text{C}$, D_{GND} , R_{GND} connected
[Input Pin]				
Input Voltage	V_{IN} , V_{SEN}	-0.3 to +7	V	
Input Current	I_{IN} , I_{SEN}	-2 to +2	mA	
Input Current (When battery is connected in reverse direction)	I_{IN_REV} , I_{SEN_REV}	-5	mA	less than 2 minutes, $T_j = 25\ ^\circ\text{C}$, R_{IN} , $R_{SEN} \geq 4.7\ \text{k}\Omega$
[SENSE pin]				
SENSE Voltage	V_{SENSE}	-0.3 to +7	V	
SENSE Current	I_{SENSE}	-20 to internal limitation (Note 1)	mA	$R_{SENSE} = 1\ \text{k}\Omega$
[OUT pin]				
Power Supply to Output Voltage	V_{DS}	-0.3 to internal limitation (Note 2)	V	
Maximum Output Current	I_{OUT}	internal limitation (Note 3)	A	Maximum $V_{BB} = 28\ \text{V}$
Single Pulse Energy Rating (Note 4)	$E_{AS_25^\circ\text{C}}$	170	mJ	$T_j = 25\ ^\circ\text{C}$, $V_{BB} = 14\ \text{V}$, $I_{OUT(START)} = 4\ \text{A}$
	$E_{AS_150^\circ\text{C}}$	70	mJ	$T_j = 150\ ^\circ\text{C}$, $V_{BB} = 14\ \text{V}$, $I_{OUT(START)} = 4\ \text{A}$
[Temperature]				
Storage Temperature Range	T_{stg}	-55 to +150	$^\circ\text{C}$	
Junction Temperature Range	T_j	-40 to +150	$^\circ\text{C}$	
Maximum Junction Temperature	T_{jmax}	150	$^\circ\text{C}$	
[ESD] (Note 5)				
Electrostatic-Discharge Capability Human Body Model - HBM	VBB, OUT pins	± 3	kV	
	IN, SEN, SENSE pins	± 2	kV	
Electrostatic-Discharge Capability Charged Device Model - CDM	All pins	± 750	V	

(Note 1) Internal limitation by SENSE voltage clamp and current-limitation protection. Please see the "Electrical Characteristics" section for more details.

(Note 2) Internal limitation by output active-clamp overvoltage protection. Please see the "Electrical Characteristics" section for more details.

(Note 3) Internal limitation by output overcurrent protection. Please see the "Electrical Characteristics" section for more details.

(Note 4) Specified by design and/or statistical analysis of correlated parameters tested in production.

(Note 5) Measured as per EIA/JEDEC and AEC-Q100 Standard. HBM-Measured as per JESD22-A114D and AEC-Q100-002.

CDM-Measured as per JESD22-C101C and AEC-Q100-011.

Caution 1: Exposure to the absolute maximum ratings may cause permanent damage to the IC, may affect the device reliability and lifetime. Therefore, operation at or above the absolute maximum ratings is not recommended. The above-described values represent stress ratings and functional operation is not implied. In addition, no destructive conditions such as short or open can be assumed.

Caution 2: If the IC is used in a manner that exceeds the maximum junction temperature the original characteristics of the IC will be degraded. If the junction temperature exceeds the maximum specified temperature, increase the board size, increase the area of copper foil for heat dissipation, or use a heat sink. Consider reducing the thermal resistance so that the maximum junction temperature is not exceeded.

Caution 3: When an inductive load is turned off, the V_{OUT} voltage drops below ground level. An integrated active-clamp (overvoltage) protection limits the maximum V_{DS} across the power transistor and the inductive energy is dissipated internally. The energy can be calculated using the following simplified equation:

Absolute Maximum Ratings – continued

$$E_L = V_{DSCLP} \times \left[\frac{V_{BB} - V_{DSCLP}}{R_L} \times \ln \left(1 - \frac{R_L \times I_{OUT(START)}}{V_{BB} - V_{DSCLP}} \right) + I_{OUT(START)} \right] \times \frac{L}{R_L}$$

Where:

L is the inductance value of the inductive load.

R_L is the resistance value of the load.

V_{BB} is the supply voltage.

V_{DSCLP} is the clamping voltage.

$I_{OUT(START)}$ is the current flowing through the inductive load at the instance the inductive load is turned off.

In simplified form, if R_L is neglected.

$$E_L = \frac{1}{2} \times L \times I_{OUT(START)}^2 \times \left(1 - \frac{V_{BB}}{V_{BB} - V_{DSCLP}} \right)$$

Caution 4: The maximum E_L energy the device can dissipate for a given $I_{OUT(START)}$ is limited by the maximum thermal transient the power transistor can handle, hence the maximum inductance L must be selected with respect to the maximum given $I_{OUT(START)}$.

Figure 4. Active Clamp Energy vs Output Current

Recommended Operating Conditions

Parameters	Symbol	MIN	TYP	MAX	Unit
Supply Nominal Voltage Range ^(Note 1)	V_{BB}	6	14	28	V
Input Voltage	V_{IN}, V_{SEN}	0	-	5.5	V
Operating Junction Temperature	T_j	-40	+25	+150	°C
Input Frequency	f_{IN}	-	-	1	kHz

(Note 1) An extended supply operating voltage range from 4.0 V up to 28 V is possible after start-up; protections are operational. The device is functional up to 36 V and protections are active, however parameter deviations are possible. Please refer to the "Electrical Characteristics" section and the "Features Description" section.

Thermal Resistance (Note 1)

Parameters	Symbol	TYP	Unit	Conditions	
HTSOP-J8					
Thermal Resistance between junction and ambient temperature	θ_{JA}	127.6	°C/W	1s	(Note 2)
		39.3	°C/W	2s	(Note 3)
		26.5	°C/W	2s2p	(Note 4)
Thermal characterization parameter between junction and top center of the outside surface of the component package	Ψ_{JT}	12	°C/W	1s	(Note 2)
		4	°C/W	2s	(Note 3)
		3	°C/W	2s2p	(Note 4)

(Note 1) Based on JESD51-2A(Still-Air). Specified by design.

(Note 2) Using a PCB board based on JESD51-3.

(Note 3) Using a PCB board based on JESD51-5.

(Note 4) Using a PCB board based on JESD51-5, 7.

Caution: The values presented here were measured/simulated under a specific set of conditions and should be regarded only as a guideline on how to estimate the thermal behavior of the application and should not be used as design parameters. A careful evaluation of the actual application values should be done to confirm the estimated results

Features Description

Input Pins

The input circuitry is compatible with 3.3 V and 5 V microcontrollers. The IN and SEN pins must be connected to the microcontroller via 4.7 kΩ resistors. In case not used, the pins shall be connected to ground via resistors; 4.7 kΩ or more is recommended.

The input circuitry reacts to voltage thresholds and avoids undefined states by use of internal hysteresis. Setting the IN pin voltage above 2.1 V the High Side Power Switch output turns on. The device is in Operating mode. Setting the SEN pin voltage above 2.1 V the diagnostic functions are activated. Setting the IN pin voltage below 0.9 V the output is turned off. Setting the SEN pin voltage below 0.9 V the diagnostic functions are deactivated.

With IN and SEN input pins "low" the device enters Sleep mode; all internal circuits are switched off to prevent current consumption from the power supply, output is turned off and no protection is active. In case the IN pin is de-asserted i.e., IN is "low" and the SEN pin is kept "high" then the device enters in a Standby mode with diagnostic functions activated. In this scenario the current consumption is reduced, but not stopped.

In case the connection is interrupted, the input pins are pulled down internally; only in case all input pins are low the Sleep mode is activated. The internal pull-down is implemented with a resistance. Furthermore, internal de-bounce filters make sure the circuits are not activated or deactivated by high frequency noise or other voltage spikes at the pins.

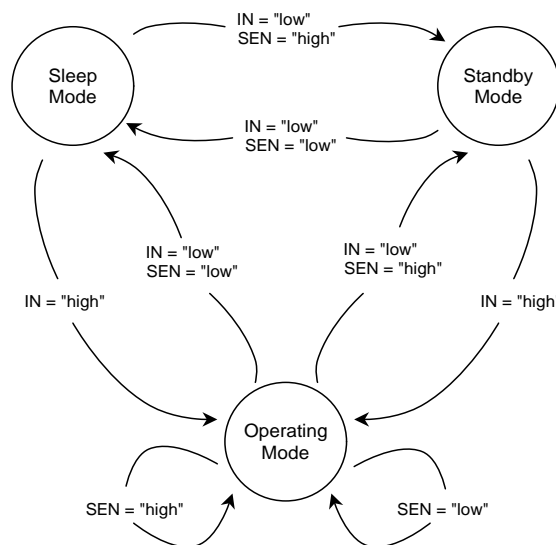

Figure 57. State Diagram

Internal Supply and Under Voltage Lock Out (UVLO)

The Power Supply Line Input V_{BB} is used to energize and supply internal circuitry and generate internal voltage references. The Intelligent High Side Power Device is designed to operate down to very low battery cranking voltages. However, as with any battery powered device it still needs a certain minimum voltage to operate. An under voltage protection circuit with hysteresis makes sure the device does nothing until the supply voltage is high enough and a predictable behavior can be maintained. The UVLO circuit prevents an undefined output state and/or unintended diagnostic functions turn on when the V_{BB} voltage is below the specified threshold.

Figure 58. UVLO Functionality

Features Description – continued

Control Circuitry

The device integrates logic circuits that control the operation of the Intelligent High Side Power Switch. Based on the state of the protection circuits and given inputs the control logic performs state transitions and produces outputs as such.

Gate Control Circuitry

The device integrates a gate driving circuit that acts as interface between the control logic and the N-channel power transistor. A charge pump acts as internal supply allowing to turn on the MOSFET and drive it in the deep triode operation region. The integrated charge pump operates at a fixed frequency improving the EMI performance of the IC. Moreover, the switching behavior of the power transistor is regulated via the gate-driver hence the on and off switching times and slew rates are current-controlled to further improve the EMC.

Figure 59. Switching Resistive Loads

Active Clamp Protection

An intelligent integrated active clamp protection limits the maximum V_{DS} across the power transistor when switching inductive loads at the output pin and the inductive energy is dissipated internally. Moreover, a VBB to GND internal clamp circuit protects the internal circuits from overvoltage surges.

Figure 60. Switching Inductive Loads

Features Description – continued

Loss of Ground Protection

When the module's ground becomes open, the outputs switch off. However, it is recommended to add resistors connected between the input pins and the microcontroller. Furthermore, it is recommended to keep all the digital inputs pulled either all high or all low to avoid creating parasitic ground paths that could prevent the outputs from switching off. If the GND pin is open when an inductive load is driven, the active clamp protection safeguards the IC.

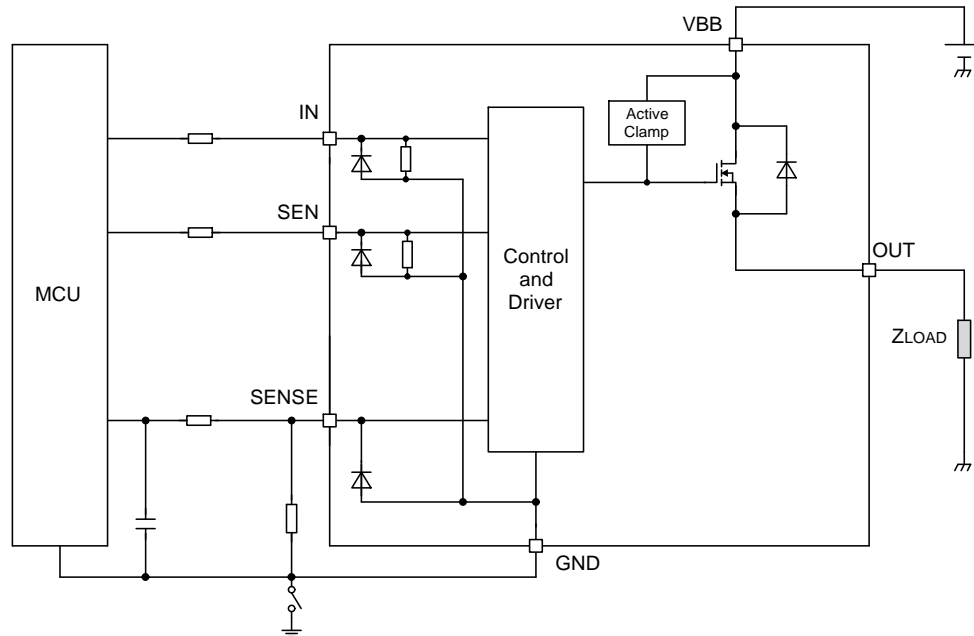

Figure 61. Loss of Ground Protection Diagram

Load Dump and Overvoltage Protection

The integrated VBB to GND overvoltage protection will safeguard the internal circuits from overvoltage transients. In order for the overvoltage protection to work a ground resistance R_{GND} is necessary. However, a ground shift needs to be considered versus the microcontroller ground when looking at the input voltage threshold levels while in normal operation. Furthermore, the active clamp protection limits the maximum V_{DS} across the power transistor. Moreover, in case the V_{BB} voltage exceeds the V_{BBCLP} level the input pins can start to conduct as well, hence input resistors are mandatory as per the above explanations.

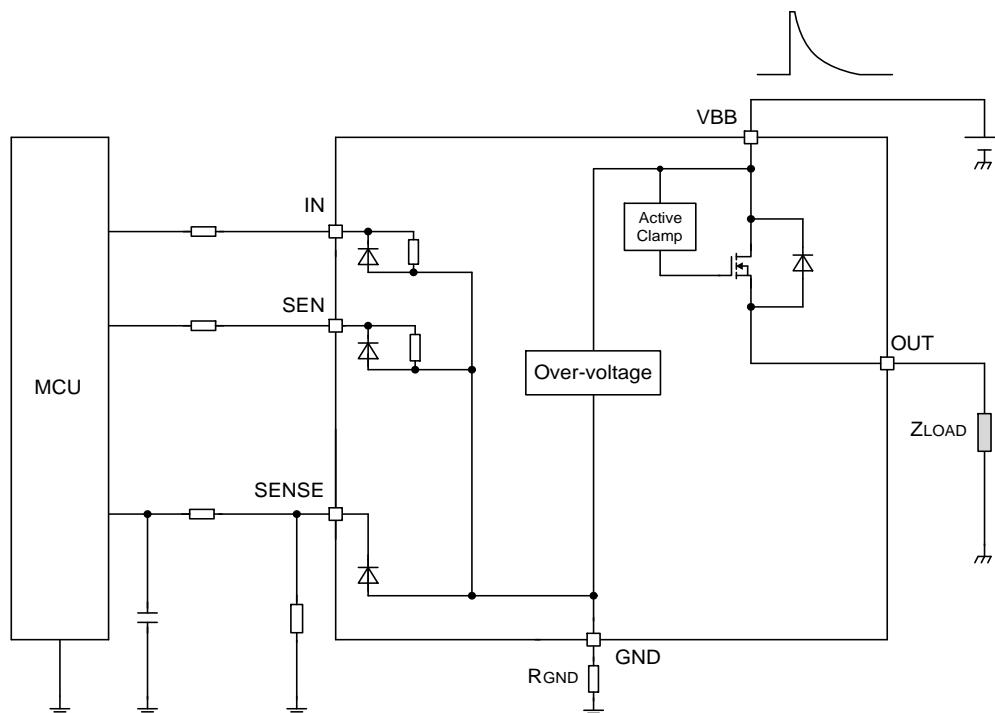

Figure 62. Load Dump Protection Diagram

Features Description – continued

Loss of Battery Protection

When the connection to the battery becomes open the device can dissipate the energy of the wire harness for inductivities up to 10 μH without degrading its robustness. The integrated VBB to GND overvoltage protection will act as a freewheeling path and the active clamp at the output will close the path for the current to flow safeguarding the IC. In applications where the nominal load currents are exceeded, and more load inductivity is expected, an external load freewheeling diode is necessary and/or a transient voltage suppressor must be present on the battery line.

Figure 63. Loss of Battery Diagram

Reverse Battery Protection

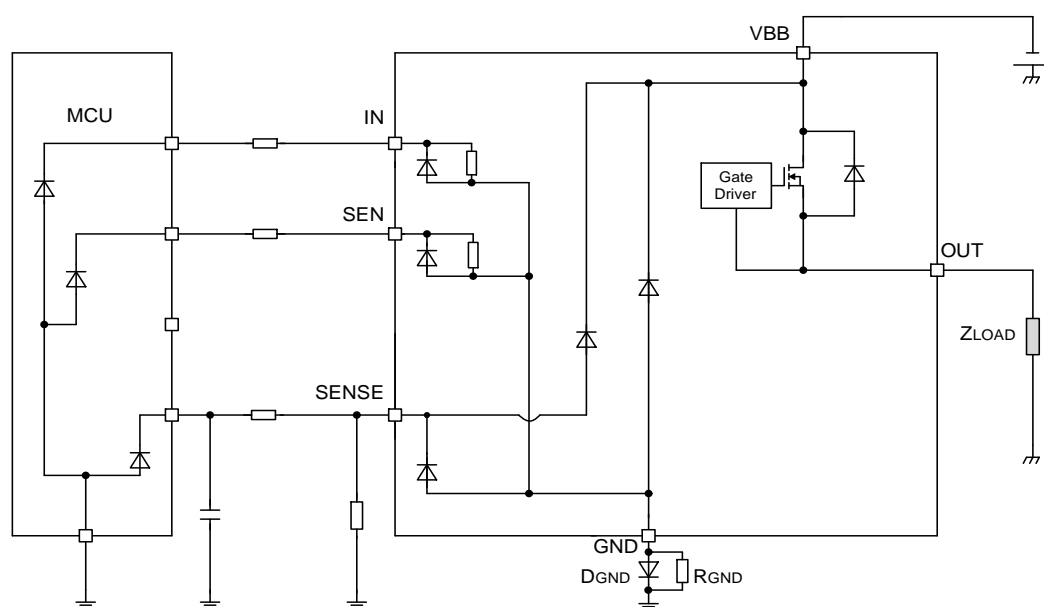

Figure 64. Reverse Battery Diagram

To limit the current through the input pins and the SENSE pin in case of reverse battery connection and negative or positive ISO transients on the battery line, the device's interface pins must be protected with resistors connected between the micro controller and the IC. Furthermore, a ground protection Schottky diode D_{GND} is recommended to help improve the robustness of the IC in such scenarios.

A ground resistor at the IC GND pin will protect the IC in reverse battery and in case of negative or positive ISO transients on the battery line. Moreover, the ground resistor safeguards the IC during load dump or over voltage. However, a ground shift needs to be considered versus the micro controller ground when looking at the input voltage threshold levels due to the chip's current consumption in normal operation. Resistor power dissipation needs to be considered during reverse battery conditions.

Features Description – continued

A diode at the IC GND pin will increase the protection level in both reverse battery and negative ISO pulse transients, however it will reduce the positive ISO pulse robustness of the IC and it will diminish the load dump and over voltage protection ability of the IC. Furthermore, it will lessen the loss of battery protection in case of wire harness inductivity; a parallel resistor to the diode is recommended in this case. If a diode is used the load dump, over voltage and loss of battery scenarios need careful examination and external transient voltage suppressors or/and load freewheeling diodes need to be considered. Moreover, a ground shift will be present versus the microcontroller ground. However, the diode could be shared between multiple devices.

During reverse battery the device allows the load current to flow through the body diode of the power MOSFET; the current must be limited by the resistance of the load. However, in case the load is inductive, special care must be taken to ensure safe operation. A reverse polarity diode on the battery line would be a possible solution.

A compromise between the above options must be found depending on the specific application requirements and the targeted loads.

Dual Temperature Shutdown Protection

A dual temperature shutdown (Dual TSD) mechanism limits the internal thermal transients and reduces the mechanical stress of the IC increasing its cyclic short-circuit robustness. The device integrates an absolute and dynamic overtemperature protection circuit. When the chip's junction temperature rises above either the T_{DTJ} or the T_{TSD} threshold, the output turns off. A thermal hysteresis restart mechanism is implemented. When the chip's temperature falls below a predefined threshold, the output automatically restarts, and operation is resumed accordingly. Moreover, the TSD circuits safeguard the IC in case of overload operation (high inrush current) with the output current below the I_{OCD} thresholds i.e., before the overcurrent protection activates. When the TSD protection is triggered, the SENSE pin acts as an error flag and signals the fault to the microcontroller. The voltage at the SENSE pin is forced to be V_{SENSEH} .

Figure 65. Overtemperature Protection

Features Description – continued

Over Current Protection

The IC has a built-in overcurrent protection feature. If an excessive current flows at the output of the High Side Power Switch, a current limitation aims to protect the IC and peripheral components. Given that a fault is present (short-circuit to ground), or high inrush current at start-up occurs, then the output current is limited to safe operating levels. Moreover, the output current limit is designed to have V_{BB} voltage dependency in favor of an increased robustness of the device. When the load current is above the I_{OCD} threshold the SENSE pin acts as an error flag and signals the fault to the microcontroller. The voltage at the SENSE pin is forced to be V_{SENSEH} . Furthermore, the overtemperature - dual temperature shutdown (TSD) protection - circuits complement the overcurrent protection. In case the overtemperature protection is triggered during current limitation the power MOSFET is turned off, hence the output current will toggle accordingly - a restart happens when the chip has cooled down sufficiently.

Figure 66. Overcurrent Protection

Reverse Current Protection

The IC allows reverse current to flow through the power MOSFET when the V_{OUT} voltage level is higher than V_{BB} . Furthermore, as long as the current is maintained within the nominal range and the package's thermal limitations are not exceeded the IC can maintain its operating state or can switch from off to on and vice versa.

Features Description – continued

Diagnostic / SENSE Functions

Diagnosis / SENSE Output^(Note 1)

Mode	IN	SEN	SENSE	OUT
Normal Operation	Low	High	Hi-Z	Low
Open Load	Low	High	Hi-Z	$< V_{BB} - V_{DSOL}$
	Low	High	V_{SENSEH}	$\geq V_{BB} - V_{DSOL}$
Short to Battery	Low	High	V_{SENSEH}	High
Thermal Shutdown	Low	High	Hi-Z	Low
Short to Ground	Low	High	Hi-Z	Low
Reverse Current	Low	High	V_{SENSEH}	High
Normal Operation	High	High	I_{OUT} / K_x	High
Open Load	High	High	I_{OUT_ONOLD} / K_x	High
Short to Battery	High	High	$< I_{OUT} / K_x$	High
Thermal Shutdown	High	High	V_{SENSEH}	Low
Short to Ground	High	High	V_{SENSEH}	Low
Reverse Current	High	High	Hi-Z	High
All modes	-	Low	Hi-Z	-

(Note 1) All values in the above table are Typ values and SENSE is considered Hi-Z looking into the pin i.e., R_{SENSE} is ignored.

The current sense and diagnostic functions are enabled by setting the voltage $V_{SEN} = \text{High}$. The operation is as per the above table. However, an external resistor R_{SENSE} must be connected between SENSE and GND pins. The simplified implementation is described in the below diagram.

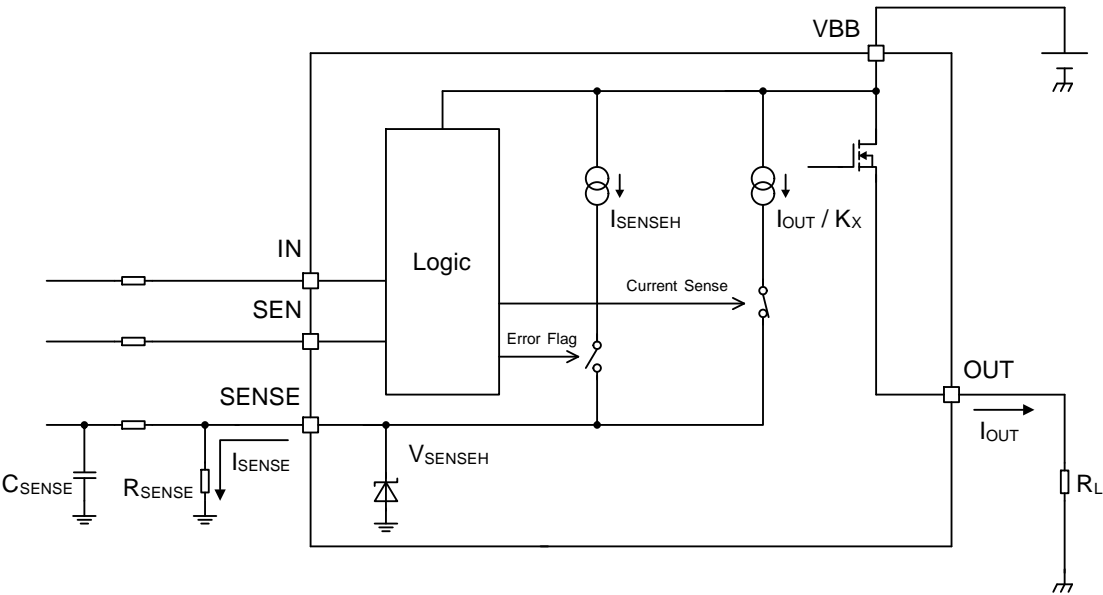

Figure 67. Diagnostic Output Block Diagram

Features Description – continued

Current Sense

When the diagnostic is enabled, and the high side power switch is turned on, a current proportional to the load current is flowing through the SENSE pin. The current I_{SENSE} becomes equal to I_{OUT} / K_X , (K_X : Current sense ratio). An external resistor R_{SENSE} is recommended, hence for example the voltage at the SENSE pin is equal to:

$$V_{SENSE} = \frac{R_{SENSE} \times I_{OUT}}{K_X}$$

Current Sense Ratio Accuracy

The below diagram shows the load current sense ratio dependency vs. the output current through the power MOSFET. The accuracy of the current sense ratio depends on the load current, technological process, voltage and temperature. A higher-precision current sense ratio could be obtained with additional calibration on the application side. The device allows derating at a specific point (ΔK_X , $T_j = 25^\circ\text{C}$). Moreover, to reduce signal ripple at the microcontroller side, it is recommended to insert an external RC filter between the SENSE pin and the ADC input pin.

Figure 68. Current Sense Ratio vs Output Load Current

Furthermore, an open load at ON condition can be recognized via the sense ratio if the load current falls below a certain threshold. This is given by the I_{OUT_ONOLD} parameter.

Open Load Detection

Open load at off can be detected by connecting an external resistance R_{OLD} between power supply V_{BB} and OUT.

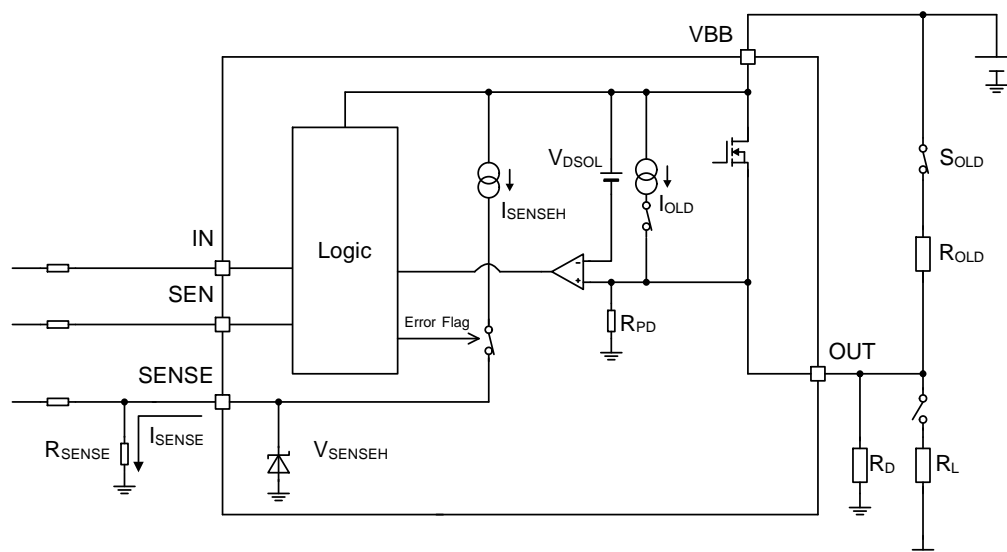

Figure 69. Open Load Detection Block Diagram

Features Description – continued

When the output load is disconnected, input pin IN is low and SEN is high, and open load will be flagged at the SENSE pin by the V_{SENSEH} voltage if the load is missing or the output is shorted to the VBB battery line. To reduce the standby current of the system, an open load switch S_{OLD} is recommended. R_D represents the minimum parasitic resistance at the output pin. In case R_D is not considered the device integrates a 500 kΩ R_{PD} resistance.

The value of external resistance R_{OLD} is decided based on the minimum power supply voltage (V_{BB}), parasitic resistance R_{PD} and open detection threshold V_{DSOL} . The equation for calculating the R_{OLD} value is shown below.

$$R_{OLD} < \frac{R_D \times R_{PD}}{R_D + R_{PD}} \times \left(\frac{V_{DSOL}}{V_{BB(min)} - V_{DSOL}} \right)$$

Moreover, in case a high ohmic open load can be considered, an integrated 100 μA I_{OLD} pull up current could help detect an open load at off without the need for any external components.

Open Load Masking Time

The IC diagnoses open load detection after the mask time t_{OLDMSK} after the IN pin is de-asserted to allow for the output voltage to drop while in normal operation (load connected).

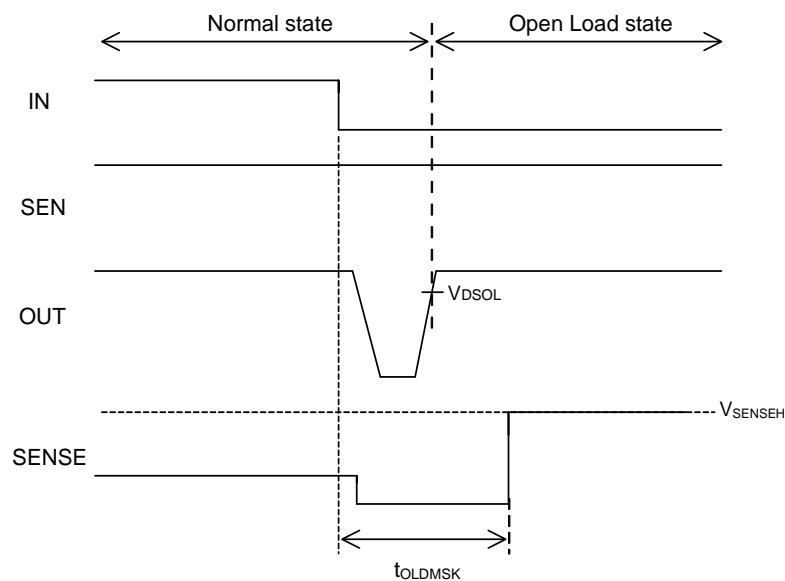

Figure 70. Open Load Mask Timing Chart

Diagnostic Timings

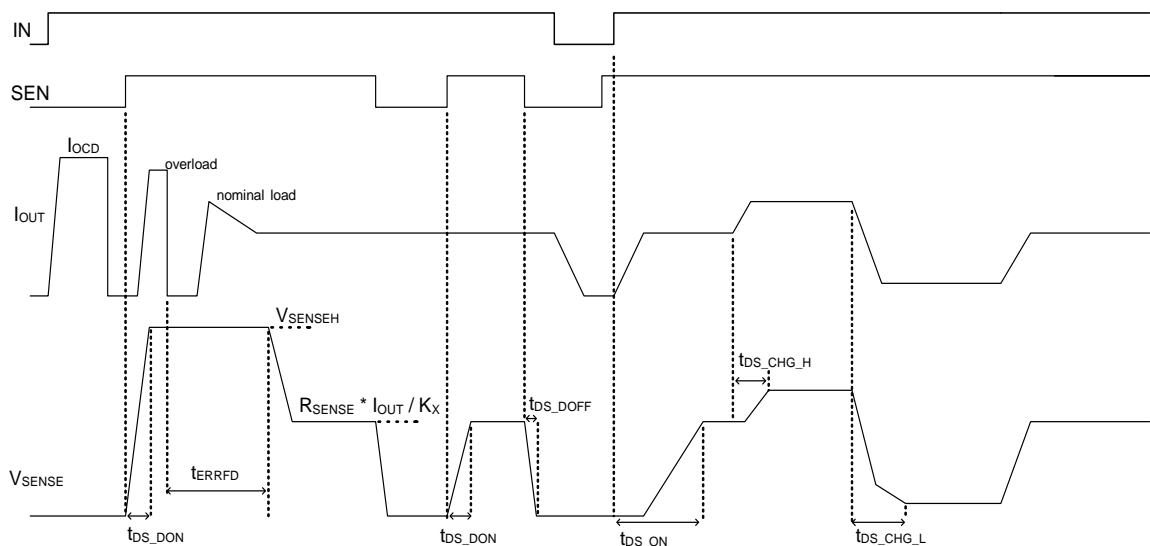

Figure 71. Diagnostics Timing Diagram

Application Circuit Example

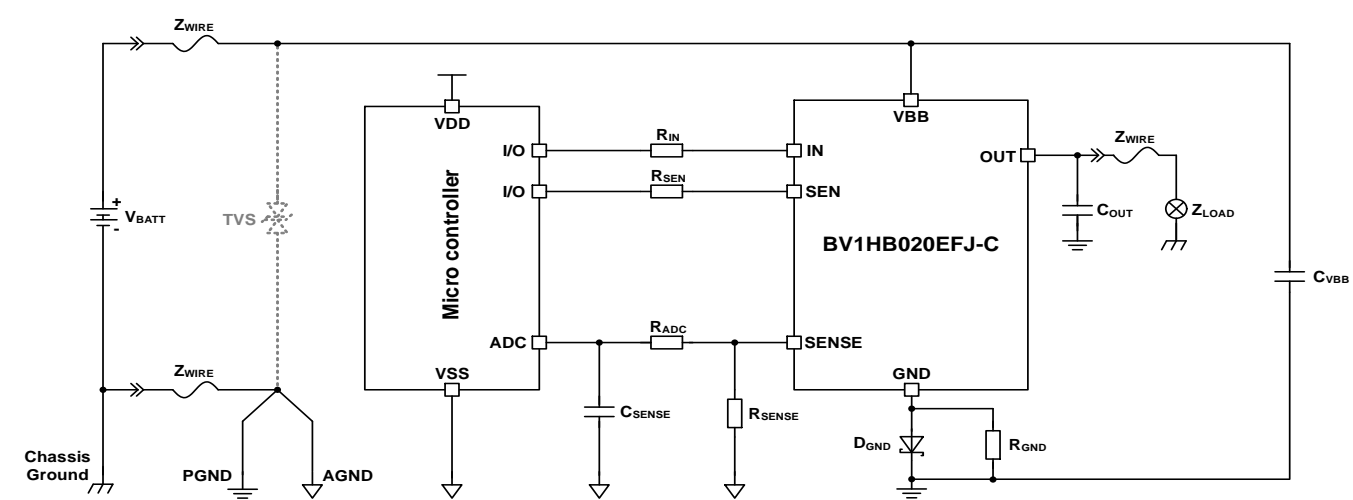

Figure 72. Application Schematic

Recommended External Components Example

Item	Symbol		Standard Value	Unit
Input Pin Resistance	R_{IN}		4.7	k Ω
Diagnostic Input Pin Resistance	R_{SEN}		4.7	k Ω
Microcontroller SENSE Pin Resistance	R_{ADC}		4.7	k Ω
SENSE Pin Resistance	R_{SENSE}		1	k Ω
SENSE Filter Capacitance	C_{SENSE}		100	pF
Output EMC Capacitance	C_{OUT}		10	nF
Battery Line Filter Capacitance	C_{VBB}		100	nF
Chip Ground Protection Impedance Network ^(Note 1)	R_{GND}		1	k Ω
	D_{GND}	V_F ^(Note 2)	0.3	V
		V_R	40	V
Transient Voltage Suppressor Diode	TVS		36	V

(Note 1) R_{GND} in parallel with the Ground protection diode is optional. R_{GND} is needed in case of loss of V_{BB} with wire harness inductivity or inductive load.
 V_F of D_{GND} is forward bias voltage, V_R of D_{GND} is reverse bias voltage.

(Note 2) V_F depends on forward current of D_{GND} . When decide forward current value, please refer to Operating Mode Current (I_{GNDH}) of the “Electrical Characteristics” section.

Operational Notes

1. Recommended Operating Conditions

The IC is designed to operate in 12 V automotive boar net applications. The functions and operation of the IC are guaranteed within the range specified by the recommended operating conditions. The characteristic values are guaranteed only under the conditions specified by the electrical characteristics. The IC can withstand transient voltages beyond the recommended operating conditions; however, parameter deviations are possible when used outside of the supply nominal voltage range. Exposure to the absolute maximum ratings may cause permanent damage to the IC.

2. Inrush Current

When a load is being activated by the IC inrush currents may flow. The IC is designed to drive high inrush current loads; however, careful consideration must be completed when pairing the IC with the load. In case special recommendations are not available in the Datasheet the minimum overcurrent protection level of the IC should be higher than the maximum expected inrush current for proper load driving.

3. Testing on Application Boards

When testing the IC on an application board, it is recommended to always discharge capacitors completely after each evaluation step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

4. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

5. Ceramic Capacitor

When using a ceramic capacitor, determine a capacitance value considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

6. Thermal Shutdown Function (TSD)

This IC has a built-in thermal shutdown function that prevents heat damage to the IC. Normal operation should always be within the IC's maximum junction temperature rating. If however the rating is exceeded for a continued period, the junction temperature (T_j) will rise which will activate the TSD function that will turn OFF power output pins. When the T_j falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD function operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD function be used in a set design or for any purpose other than protecting the IC from heat damage.

7. Over Current Protection Function (OCP)

This IC integrates an overcurrent limitation protection function that is activated when the load is shorted towards ground. This protection function is effective in preventing damage due to sudden and unexpected fault events. However, the IC should not be used in applications characterized by continuous operation of the protection function.

8. Active Clamp Operation

The IC integrates the active clamp function to internally absorb the reverse energy E_L which is generated when the inductive load is turned off. When the active clamp operates, the thermal shutdown function does not work. Decide a load so that the reverse energy E_L is active clamp energy (Single Pulse) E_{AS} (refer to Figure 4. Active Clamp Energy vs Output Current) or under when inductive load is used.

9. Reverse Battery Connection

Connecting the power supply i.e., the battery with a reversed polarity can damage the IC. Precautions must be taken against reverse polarity when connecting the power supply, such as mounting an external diode between the battery feed and the IC's power supply, blocking all current paths. Alternatively, inserting a blocking diode or resistance in series with the IC's GND pin will prevent or limit the current from flowing into the control circuits of the high side switch respectively. However, current thorough the body diode of the integrated power FET must be limited by the resistive component of the load. The current through the Digital inputs and SENSE pins must be limited too with protection resistors.

10. Power Supply and PCB Layout

Design the PCB layout in order to provide sufficient cooling to the IC. Connect the exposed pad with sufficient thermal vias to power supply copper plane to dissipate as much as possible thermal energy to the environment. Furthermore, connect as close as possible to the IC a capacitor between power supply and ground pins. Minimize the input capacitance of the digital input pins by placing the protection resistors as close as possible to the IC. Place the ground network as close as possible to the IC. Place the sense pin resistance as close as possible to the IC and the R-C filtering network close to the microcontroller. Place the output capacitors as close as possible to the IC. Short all output pins of the respective channel on the PCB to ensure equal current distribution. It is usually recommended to use a PCB with an internal copper layer as a power supply plane and another internal copper layer as a ground plane for thermal and EMC considerations respectively.

Operational Note – continued**11. Ground Shift and Ground Wiring Pattern**

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. The IC is robust against small ground shift, however, ensure that the ground traces of external components do not cause big variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance. Big ground shifts could cause additional switching losses and electromagnetic emissions.

12. Reverse Current

A capacitive or inductive type of load can cause the output of the IC to rise above the input power supply level. The IC is designed to accept reverse current and normal operation is maintained as long as the reverse current is below the specified levels. Therefore, give special consideration to the maximum amount of reverse current that can flow through the device.

13. Undervoltage or Loss of Battery

The IC is designed to automatically switch off in case of loss of battery/power supply or undervoltage events. The IC will restart once the battery exceeds the specified operation threshold. In case the load is inductive a resistor on the ground network is recommended if loss of battery is foreseen at the same time in the application.

14. Loss of Ground

The IC cannot operate without the appropriate ground connection; nonetheless, the IC will automatically switch off in case of loss of ground. However, careful consideration of the external state of the inputs must be considered in order to avoid creating parasitic paths to another ground in the application via the external circuitry.

15. Load Dump and Overvoltage Protection

The IC is designed with integrated overvoltage protection to safeguard its internal circuits. For the overvoltage protection to work a ground resistance R_{GND} is necessary. Furthermore, input pins' protection resistors are mandatory. In case of Load dump external TVS protection diodes must be connected to safeguard the system.

16. Open Load or Short to Battery

An open load event is not considered dangerous to the IC; moreover, the IC can detect such failure and signal the fault to the microcontroller. In case a short to battery is present the load is turned on independent of the state of the IC. The device can be used to detect such a failure and signal the fault to the microcontroller.

17. Internally Not Connected (N.C.) Pins

Pins that are specified as internally not connected have no physical connection to the IC. For mechanical reasons it is recommended to solder them on the PCB. Electrically they can remain not connected in the circuit or may be connected to different signals especially when using high current outputs.

Notice

Precaution on using ROHM Products

1. If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), aircraft/spacecraft, nuclear power controllers, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - [a] Installation of protection circuits or other protective devices to improve system safety
 - [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure
3. Our Products are not designed under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
 - [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - [f] Sealing or coating our Products with resin or other coating materials
 - [g] Use of our Products without cleaning residue of flux (Exclude cases where no-clean type fluxes is used. However, recommend sufficiently about the residue.); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - [h] Use of the Products in places subject to dew condensation
4. The Products are not subject to radiation-proof design.
5. Please verify and confirm characteristics of the final or mounted products in using the Products.
6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse, is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
8. Confirm that operation temperature is within the specified range described in the product specification.
9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
