LDO Regulators with Watch Dog and Timer Voltage Detector

550 mA Output LDO Regulator with WDT and Voltage Detector

**BD4271HFP-C  BD4271FP2-C**

### General Description

BD4271HFP-C is an automotive voltage regulator with watchdog timer and offers the output current of 550mA while limiting the quiescent current low. A logical "HIGH" at the CTL pin enables the LDO regulator and "LOW" disables the LDO regulator and keeps current consumption low. A reset signal is generated for an output voltage \( V_O \) of Typ 4.65V. The reset delay time and watchdog time (WDT) can be programmed by the external capacitor.

### Features

- Low ESR ceramic capacitors applicable for output
- Low drop voltage: PDMOS output transistor
- Power on and under-voltage reset
- Programmable reset delay and watchdog time by external capacitor

### Applications

- Onboard vehicle device
  (Engine ECU, Body-control, Car Stereos, Satellite Navigation System, etc.)

### Typical Application Circuit

\[ C_{IN} \geq 0.1 \mu F, \ C_{CT} = 0.001 \mu F \text{ to } 10 \mu F, \ C_{O} \geq 6 \mu F \]

### Key Specifications

- AEC-Q100 qualified *(Note 1)*
- Qualified for Automotive Applications
- Wide Temperature Range (\( T_J \)): \(-40 ^\circ \text{C} \) to \(+150 ^\circ \text{C} \)
- Wide Operating Input Range: \(-0.3 \text{ V} \) to \(45 \text{ V} \)
- Low Quiescent Current: 75 \( \mu \text{A} \) (Typ)
- Output Load Current: 550 mA
- Output Voltage: 5.0 V (Typ) ± 2 %
- Reset Detect Voltage Accuracy: 4.53 V to 4.77 V
  4.65 V (Typ)
- Enable input
- Over Current Protection (OCP)
- Thermal Shut Down (TSD)
  *(Note1: Grade 1)*

### Package

- HFP: HRP7 9.395 mm \times 10.540 mm \times 2.005 mm
- FP2: TO263-7 10.00 mm \times 14.95 mm \times 4.50 mm

---

*Product structure : Silicon monolithic integrated circuit
This product is not designed protection against radioactive rays

Caution: Exceeding the absolute maximum rating for supply voltage, operating temperature or other parameters can result in damages to or destruction of the chip. In this event it also becomes impossible to determine the cause of the damage (e.g. short circuit, open circuit, etc.). Therefore, if any special mode is being considered with values expected to exceed the absolute maximum ratings, implementing physical safety measures, such as adding fuses, should be considered.

(Notes)

- td, tWH, and tWL can be varied by changing the CT capacitance value. (0.001 μF to 0.1 μF available)
- tH (ms) = tH (the Delay Time at 0.1μF) × CCTL (μF) / 0.1 for example: when CCTL = 1μF, 80ms ≤ tH ≤ 160 ms
- tWH (ms) = tWH (the WDT Monitor Time at 0.1μF) × CCTL (μF) / 0.1 for example: when CCTL = 1μF, 300ms ≤ tWH ≤ 660 ms
- tWL (ms) = tWL (the WDT Reset Time at 0.1μF) × CCTL (μF) / 0.1 for example: when CCTL = 1μF, 50ms ≤ tWL ≤ 150 ms
- tD (ms) = tD (the Delay Time at 0.1μF) × CCTL (μF) / 0.1 ± 0.1 for example: when CCTL = 0.01μF, 0.7ms ≤ tD ≤ 1.7 ms
- tWH (ms) = tWH (the WDT Monitor Time at 0.1μF) × CCTL (μF) / 0.1 ± 0.1 for example: when CCTL = 0.01μF, 2.9ms ≤ tWH ≤ 6.7 ms
- tWL (ms) = tWL (the WDT Reset Time at 0.1μF) × CCTL (μF) / 0.1 ± 0.1 for example: when CCTL = 0.01μF, 0.4ms ≤ tWL ≤ 1.6 ms

Timing Chart

1. When supply voltage $V_{CC}$ is ON $\leftrightarrow$ OFF (Not to input CLK voltage $V_{CLK}$ when output voltage $V_O$ = Low)

Figure 24. Timing Chart 1
Timing Chart — continued

2. When output control voltage $V_{CTL}$ is ON $\leftrightarrow$ OFF (Not to input CLK voltage $V_{CLK}$ when output voltage $V_O = \text{Low}$)

The Delay Time ($t_d$) is estimated roughly by following calculation.

$$t_d [s] \approx \frac{V_{CTH}[V] \times C_{CT}[F]}{I_{CT}(\text{charge})[A]}$$

Basically, verify the Delay Time ($t_d$) by the ratio of the value at $C_{CT} = 0.1\mu F$ specified in datasheet and the actual $C_{CT}$ capacitance used to calculate.
Timing Chart – continued

3. When WDT threshold Voltage $V_{\text{CLK}}$ is ON ↔ OFF

The WDT Monitor Time ($t_{\text{WH}}$) and the WDT Reset Time ($t_{\text{WL}}$) is estimated roughly by the following calculation.

$$t_{\text{WH}}[s] \approx \frac{|V_{\text{CTH}} - V_{\text{CTL}}|[V] \times C_{\text{CT}}[\mu \text{F}]}{I_{\text{CT}}\text{(discharge)}[\text{A}]}$$

$$t_{\text{WL}}[s] \approx \frac{|V_{\text{CTL}} - V_{\text{CTH}}|[V] \times C_{\text{CT}}[\mu \text{F}]}{I_{\text{CT}}\text{(charge)}[\text{A}]}$$

Basically, verify the WDT Monitor Time ($t_{\text{WH}}$) and the WDT Reset Time ($t_{\text{WL}}$) by the ratio of the value at $C_{\text{CT}} = 0.1\mu \text{F}$ specified in datasheet and the actual $C_{\text{CT}}$ capacitance used to calculate.
Selection of Components Externally Connected

• VCC pin capacitor
  Insert capacitors with a capacitance of 0.1 μF or higher between the VCC and GND pin. We recommend using ceramic capacitor generally featuring good high frequency characteristic. When selecting a ceramic capacitor, please be consider about temperature and DC - biasing characteristics. Place capacitors closest possible to VCC - GND pin. When input impedance is high, e.g. in case there is distance from battery, line voltage drop needs to be prevented by large capacitor. Choose the capacitance according to the line impedance between the power smoothing circuit and the VCC pin. Selection of the capacitance also depends on the applications. Verify the application and allow sufficient margins in the design. We recommend using a capacitor with excellent voltage and temperature characteristics.

• Output pin capacitor
  In order to prevent oscillation, a capacitor needs to be placed between the output pin and GND pin. We recommend using a ceramic capacitor with a capacitance of 6 μF or higher. In selecting the capacitor, ensure that the capacitance of 6 μF or higher is maintained at the intended applied voltage and temperature range. Due to changes in temperature the capacitor's capacitance can fluctuate possibly resulting in oscillation.
  In actual applications the stable operating range is influenced by the PCB impedance, input supply impedance and load impedance. Therefore verification of the final operating environment is needed. When selecting a ceramic capacitor, we recommend using X7R or better components with excellent temperature and DC - biasing characteristics and high voltage tolerance.
  In case of the transient input voltage and the load current fluctuation, output voltage may fluctuate. In case this fluctuation can be problematic for the application, connect low ESR capacitor (capacitance > 6 μF, ESR < 1 Ω) in paralleled to large capacitor with a capacitance of 13 μF or higher and ESR of 5 Ω or lower. Electrolytic and tantalum capacitors can be used as large capacitor. When selecting an electrolytic capacitor, please consider about increasing ESR and decreasing capacitance at cold temperature.
  Place the capacitor closest possible to output pin.

![Figure 29. TO263-7 Package Data](image)
Thermal Design

This product exposes a frame on the back side of the package for thermal efficiency improvement. Within this IC, the power consumption is decided by the dropout voltage condition, the load current and the circuit current. Refer to power dissipation curves illustrated in Figure 28, 29 when using the IC in an environment of Ta ≥ 25 °C. Even if the ambient temperature Ta is at 25 °C, depending on the input voltage and the load current, chip junction temperature can be very high. Consider the design to be Tj ≤ Tjmax = 150 °C in all possible operating temperature range. Should by any condition the maximum junction temperature Tjmax = 150°C rating be exceeded by the temperature increase of the chip, it may result in deterioration of the properties of the chip. The thermal impedance in this specification is based on recommended PCB and measurement condition by JEDEC standard. Verify the application and allow sufficient margins in the thermal design by the following method is used to calculate the junction temperature Tj. Tj can be calculated by either of the two following methods.

1. The following method is used to calculate the junction temperature Tj.
   \[ Tj = Ta + PC \times \theta_{JA} \]
   
   \[ \begin{align*} 
   Tj &: \text{Junction Temperature} \\
   Ta &: \text{Ambient Temperature} \\
   PC &: \text{Power Consumption} \\
   \theta_{JA} &: \text{Thermal Impedance (Junction to Ambient)} 
   \end{align*} \]

2. The following method is also used to calculate the junction temperature Tj.
   \[ Tj = TT + PC \times \Psi_{JT} \]

   \[ \begin{align*} 
   Tj &: \text{Junction Temperature} \\
   TT &: \text{Top Center of Case's (mold) Temperature} \\
   PC &: \text{Power Consumption} \\
   \Psi_{JT} &: \text{Thermal Impedance (Junction to Top Center of Case)} 
   \end{align*} \]

The following method is used to calculate the power consumption Pc (W).

\[ PC = (VCC - VO) \times IO + VCC \times ICC \]

\[ \begin{align*} 
PC &: \text{Power Consumption} \\
VCC &: \text{Supply Voltage} \\
VO &: \text{Output Voltage} \\
IO &: \text{Load Current} \\
ICC &: \text{Circuit Current} 
\end{align*} \]

**Calculation Example**

If VCC = 13.5 V, VO = 5.0 V, IO = 200 mA, ICC = 85 μA, the power consumption Pc can be calculated as follows:

\[ PC = (13.5 V - 5.0 V) \times 200 mA + 13.5 V \times 85 \mu A \]
\[ = 1.7 W \]

At the ambient temperature Tamax = 85°C, the thermal impedance (Junction to Ambient) \( \theta_{JA} = 22.0 °C / W \) (4-layer PCB),

\[ Tj = Tamax + PC \times \theta_{JA} \]
\[ = 85 °C + 1.7 W \times 22.0 °C / W \]
\[ = 122.4 °C \]

When operating the IC, the top center of case's (mold) temperature TT = 100°C, \( \Psi_{JT} = 6 °C / W \) (1-layer PCB),

\[ Tj = TT + PC \times \Psi_{JT} \]
\[ = 100 °C + 1.7 W \times 6 °C / W \]
\[ = 110.2 °C \]

For optimum thermal performance, it is recommended to expand the copper foil area of the board, increasing the layer and thermal via between thermal land pad.
### Application Examples

- **Applying positive surge to the VCC**
  If the possibility exists that surges higher than 45 V will be applied to the VCC, a Zener Diode should be placed between the VCC and GND as shown in the figure below.

![Positive Surge Diagram](image1)

- **Applying negative surge to the VCC**
  If the possibility exists that negative surges lower than the GND are applied to the VCC, a Shottky Diode should be placed between the VCC and GND as shown in the figure below.

![Negative Surge Diagram](image2)

- **Implementing a Protection Diode**
  If the possibility exists that a large inductive load is connected to the output pin resulting in back-EMF at time of startup and shutdown, a protection diode should be placed as shown in the figure below.

![Protection Diode Diagram](image3)

- **Reverse Polarity Diode**
  In some applications, the VCC and the VO potential might be reversed, possibly resulting in circuit internal damage or damage to the elements. For example, the accumulated charge in the output pin capacitor flowing backward from the VO to the VCC when the VCC shorts to the GND. In order to minimize the damage in such case, use a capacitor with a capacitance less than 1000 μF. Also by inserting a reverse polarity diode in series to the VCC, it can prevent reverse current from reverse battery connection or the case. When the point A is short-circuited GND, if there may be any possible case point B is short-circuited to GND, we also recommend using a bypass diode between the VCC and the VO.

Operational Notes

1. **Reverse Connection of Power Supply**
   Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply terminals.

2. **Power Supply Lines**
   Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. **Ground Voltage**
   Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient conditions.

4. **Ground Wiring Pattern**
   When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. **Thermal Consideration**
   The power dissipation under actual operating conditions should be taken into consideration and a sufficient margin should be allowed for in the thermal design. On the reverse side of the package this product has an exposed heat pad for improving the heat dissipation. Use both the front and reverse side of the PCB to increase the heat dissipation pattern as far as possible. The amount of heat generated depends on the voltage difference across the input and output, load current, and bias current. Therefore, when actually using the chip, ensure that the generated heat does not exceed the Pd rating. Should by any condition the maximum junction temperature $T_{J \text{max}} = 150^\circ\text{C}$ be exceeded by the temperature increase of the chip, it may result in deterioration of the properties of the chip. The thermal impedance in this specification is based on recommended PCB and measurement condition by JEDEC standard. Verify the application and allow sufficient margins in the thermal design.

6. **Recommended Operating Conditions**
   These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. **Rush Current**
   When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. **Testing on Application Boards**
   When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC’s power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

9. **Inter-pin Short and Mounting Errors**
   Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.
Operational Notes – continued

10. Unused Input Terminals
Input terminals of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input terminals should be connected to the power supply or ground line.

11. Regarding the Input Pin of the IC
This monolithic IC contains P+ isolation and P substrate layers between adjacent elements in order to keep them isolated. P/N junctions are formed at the intersection of these P layers with the N layers of other elements to create a variety of parasitic elements.
For example, in case a resistor and a transistor are connected to the pins as shown in the figure below then:
○ The P/N junction functions as a parasitic diode when the GND > pin A for the resistor, or the GND > pin B for the transistor.
○ Also, when the GND > pin B for the transistor (NPN), the parasitic diode described above combines with the N layer of the other adjacent elements to operate as a parasitic NPN transistor.
Parasitic diodes inevitably occur in the structure of the IC. Their operation can result in mutual interference between circuits and can cause malfunctions and, in turn, physical damage to or destruction of the chip. Therefore do not employ any method in which parasitic diodes can operate such as applying a voltage to an input pin that is lower than the (P substrate) GND.

12. Ceramic Capacitor
When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

13. Thermal Shutdown Circuit (TSD)
This IC incorporates an integrated thermal shutdown circuit to prevent heat damage to the IC. Normal operation should be within the power dissipation rating, if however the rating is exceeded for a continued period, the junction temperature (Tj) will rise and the TSD circuit will be activated and turn all output pins OFF. After the Tj falls below the TSD threshold the circuits are automatically restored to normal operation.
Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

14. Over Current Protection Circuit (OCP)
This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

Notice

Precaution on using ROHM Products

1. If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment, aircraft/spacecraft, nuclear power controllers, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property (“Specific Applications”), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM’s Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:

[a] Installation of protection circuits or other protective devices to improve system safety
[b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are not designed under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:

[a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
[b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
[c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
[d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
[e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
[f] Sealing or coating our Products with resin or other coating materials
[g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
[h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification
Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   - the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
   - the temperature or humidity exceeds those recommended by ROHM
   - the Products are exposed to direct sunshine or condensation
   - the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
